COMPOSITE HOLDING DEVICE

ABSTRACT

A composite holding device, includes a casing for accommodating a plurality

of holders for holding media to serve either different or similar purposes, a supporting section for supporting the holders to be movable in an axial direction in the casing, a feed mechanism, provided in the casing, for selectively advancing one of the plurality of holders, and a manipulating mechanism for operating the feed mechanism, to project the tip of one of the plurality of holders out of a fore end

holders. A supported section of each holder supported by the supporting section is rotatably supported in relation to the supporting section.

opening at the tip of the casing and make usable the tip of one of the plurality of
